Note Photoshop Elements is the free version of Photoshop. It doesn't come with any bells and whistles that Photoshop does, but it gives you enough to work with. ## Using the Layers Panel One of the best things about Photoshop is the Layers panel, which I cover in the upcoming sections, "Creating and Working with Layers," and "Making Layers Visible and Invisible." This panel is a window into Photoshop where you can create and save multiple layers and add effects to them. You can rearrange and resize layers, erase layers, add filters, and so on. It's a very powerful tool and the best place to start working with Photoshop.

Project Summary The HIV epidemic continues unabated, with 1.2 million new infections occurring worldwide in 2011, despite widespread access to combination antiretroviral therapy (cART). A significant proportion of HIV-infected individuals develop chronic non-AIDS diseases and co-morbidities, and while combination antiretroviral therapy has greatly extended life expectancy in this population, it is now recognized that there is a growing burden of HIV-related illnesses, including cardiovascular, metabolic, hepatic, renal, and malignancies. Patients on cART experience greater incidence and accelerated progression to AIDS and non-AIDS diseases than the general population, which is thought to be due to ongoing inflammation and immune activation. However, while these observations suggest that virologic control can directly impact the natural history of HIV disease, the mechanisms linking viral replication to this greater disease burden remain incompletely understood. It is known that elevated levels of inflammation and immune activation are present in individuals with uncontrolled viral replication, and that proinflammatory cytokines such as tumor necrosis factor (TNF) and interleukin-6 (IL-6) are associated with adverse outcomes in both HIV-infected and uninfected individuals. In addition, increased concentrations of pro-inflammatory cytokines such as TNF, IL-6 and sCD14 (a marker of systemic inflammation) have been linked to the development of cardiovascular disease, insulin resistance, and hepatic dysfunction in the general population. In HIV-infected individuals, chronic inflammation and immune activation, as well as levels of pro-inflammatory cytokines, are higher in virologic controllers than in individuals with plasma HIV RNA levels
