The new Hydrangea plant is a product of a planned breeding program conducted by the Inventor in De Kwakel, The Netherlands. The objective of the breeding program is to create new freely-branching Hydrangea plants with early and freely flowering habit and attractive inflorescence form and coloration. The new Hydrangea plant originated from a cross-pollination in August, 2008 in De Kwakel, The Netherlands of Hydrangea macrophylla 'Cirque', disclosed in U.S. Plant Pat. No. 19,266, as the female, or seed, parent with Hydrangea macrophylla 'Inemozem', disclosed in U.S. Plant Pat. No. 18,964, as the male, or pollen, parent. The new Hydrangea plant was discovered and selected by the Inventor as a single flowering plant within the progeny of the stated cross-pollination in a controlled greenhouse environment in De Kwakel, The Netherlands in June, 2010. Asexual reproduction of the new Hydrangea plant by softwood stem cuttings in a controlled greenhouse environment in De Kwakel, The Netherlands since June, 2010 has shown that the unique features of this new Hydrangea plant are stable and reproduced true to type in successive generations.Practical implementation

The largest known megalithic structures are the so-called "great stones" of the Great Pyramid of Giza and Stonehenge in England (see image), both of which are about 56 meters (185 feet) high and weigh about 20 million tons (or more), according to this site. So, how do these structures, with their associated mass of weight, get up to such a height, and how do they stay up to it? I know that in the case of Stonehenge, the large stones were dragged (if I'm not mistaken), and I'm sure that some other structure had to lift the rocks in the case of the pyramids, but what about the difference between those two? A: On the Wikipedia page for the Pyramids of Giza, there are diagrams showing how those structures were constructed from much smaller building blocks. Although that article isn't so clear on the specific mechanics, it does mention that the pyramids and Sphinx are made from the same material, and that it was mixed with mortar, sand, and water to make a type of concrete. For the purpose of comparison, here's a picture of the Temple of Artemis at
