I want to do it by String value. A: You can use Random class and string.getRandom to get a random string from the given string. String input = "input"; Random r = new Random(); int randomInt = r.nextInt(input.length()); String randomString = input.substring(randomInt, randomInt + 1); Seasonal variation in post-diarrhea vomiting in children with acute diarrhoea. From what I have read it is recommended to use function returns and that you do not use exceptions. This seems like a possible solution to my problem, but I am a little confused as to how this should be applied in my scenario. I am fairly new to c# and programming in general. Q: How do I understand a `void` in a pseudocode sense? Okay, I've learned Java at uni but I have difficulty understanding a pseudocode concept described as "the void return type" and later the "void arguments". Could someone give me a real life example of how they would use these things? I'd like to know more before I continue to my homework. A: void could be used in a function definition to mean "this function returns nothing" or "this function can accept any arguments". It would normally be used if you wanted the compiler to ensure the return type is void. For example: public void add(int a, int b) { int c = a + b; System.out.println(c); } Would normally be written as follows: public int add(int a, int b) { int c = a + b; return c; } Or: public void add(int a, int b) { System.out.println(a + b); } (as there's no need for a return statement when calling the function) The arguments can be used to signify either: that the function accepts no arguments, as in the case of the first example (or when you just wish to give the function a name), that the function takes any number of arguments, as in the case of the second example. A: void in C means "return nothing". void can also mean "argument counts don't matter". I believe this is used in documentation when a function does not return any values, or accepts any arguments. Like void foo(int bar, int baz). No return values, no arguments. It could be documented as foo(x, y). A: The void return type means that it has no return value of any kind. It could be a void-returning method, or it could be a void return statement. void is also similar to void return type. It means that it doesn't return anything from the method it's in. An example of a method of one or more parameters which returns void: public void display(String x) { System.out.println(x); }
