AnyDVD HD Crack download key is the one of the most essential tools to completely remove DRM from any video and image format.Q: Python: Too many statements in a single line What is the correct way to write a python function so as not to be illegal in Python? The

following is not correct: `def my_function(my_name): print "Hello %s" % my_name` `c = my_function("World")` The reason for asking this is that I have recently updated the code in my project and now the assignment operator `=` is no longer allowed in Python. A: The proper way to do it is with `*args` and `**kwargs`: `def my_function(*args, **kwargs): print("Hello", *args, **kwargs)` `>>> my_function("World")` Hello World Your example would work without the call to `print`, but then it wouldn't be clear what you wanted to print. A: Python is very

forgiving. If you have some code that is legal in Python 3, and you just don't want to rewrite it for some reason, you can use the following trick:

```
def bad_function():  
    try:  
        bad_statement1  
    except Exception as e:  
        bad_statement2  
    finally:  
        bad_statement3
```

This will work if the code is legal Python in the first place, and you just don't want to rewrite it for some reason. Basically, all of the code after the `try: statement` is executed at least once if no exception is raised, and is only executed once if an exception is raised. This trick can be used to avoid the notorious "Exception

in thread" and "NameError: global name not defined" and any number of other runtime errors (see this question). A: Do as the others have said. When writing your code, always use the function as an expression as well.
