Field of the Invention

The present invention relates to a display device, and more particularly, to a display device including a display element having a

memory function. 2.
Description of the
Related Art In recent
years, a variety of
technologies for a
display device having a
memory function of
storing data used for a
predetermined process
are developed. In a
display device including
a display element having
a memory function, a

memory area in which data is stored in a group of pixels corresponding to one display screen is set in advance in the display element, and in the memory area, data is stored in accordance with the display content to be displayed. When data is read out from a memory area, the data is subjected to a

predetermined process, such as compensating a drive element or correcting a brightness of each pixel. In the display device, the data stored in the memory area is required to be correctly read out and subjected to a predetermined process. For this reason, a display device in which a data

reading circuit for obtaining an output by reading the data from a memory area is provided separately from a signal processing circuit of the display element and a signal processing circuit for outputting a signal in accordance with the data read out from the memory area is provided separately is known

(refer to, for example, Japanese Patent Application Laid-Open No. 2001-356533). The above-described display device having a memory function has had the following problems. In a memory area, since the data is maintained at a predetermined potential, a short-circuit between adjacent electrodes or a

light leakage may occur due to the potential variation of the data due to charge or discharge. Since a transistor is a basic component of a memory area, a component for holding a potential, such as a capacitor or a diode, is used. However, the capacitor may cause change in the

characteristic depending on the environmental temperature, the number of writing/reading of data, or the like, and the characteristic variation of the capacitor may also occur due to the repetition of the writing/reading of data.
