For example, if I have this string: "Hello world!" The character with highest frequency is 'l' (the letter appears 4 times), while the character with second highest frequency is '!', which appears 2 times. I just want the character with highest frequency. How can I do it? A: First calculate the total frequency of all characters (count_characters() function):
total_frequency = [count_characters('Hello world!') # 9 for _ in range(1000)] Then for each character we count frequency of appearances, and sort it: def get_freq(char): count_characters = [count_characters(i) for i in char] count_frequency =

```
sorted(count_characters, key=lambda x: x[1], reverse=True) return
count_frequency[0][0] def main(): words = ['Hello world!', 'stack',
'overflow'] freq_words = [get_freq(w) for w in words] print('The most
common character in these words is:', freq_words[0]) if __name__ ==
'__main__': main()

Isolation and characterization of a d-galactose-binding protein from *Proteus penneri*. A d-galactose-binding protein was isolated and purified from the cell-free extract of *Proteus penneri* by using a combination of affinity chromatography on lactose-Sepharose and DEAE-cellulose anion-exchange chromatography. The binding protein had an apparent molecular weight of 200,000 as determined by gel filtration chromatography. The purified protein had high affinity for d-galactose, the K_d was 3.13 mM at 0.2 M NaCl.
