Serial means a. The invention relates to an arrangement for absorbing kinetic energy of a locking mechanism for a vehicle door, said arrangement comprising an energy store and a force transfer element interconnecting the energy store and the locking mechanism, the force transfer element having a force transfer region of variable stiffness. In a door which is locked by a locking mechanism, problems can occur, such as the door closing too slowly, the door remaining open for a long period of time or excessive noise being produced. Many of these problems may be attributed to the properties of the locking mechanism, such as the locking force as a function of the locking pressure, the mechanical properties, the deformation of the locking mechanism and the like. So-called ancillary arrangements of this type for absorbing kinetic energy of a locking mechanism are known, for example, from German Patent Specification No. 3,430,835. The known arrangement comprises a double-acting bellows which is connected to a force transfer element which is connected to the locking mechanism. The bellows is filled with a suitable medium, such as air. In this case, the locking mechanism is provided with a locking element. In a locking position of the locking mechanism, the locking element is in engagement with the bellows and the medium contained therein. In this state, energy is absorbed from the locking mechanism by the medium contained in the bellows. When the locking mechanism is in a released position, the locking element is disconnected from the bellows and the medium contained therein. As a result, the kinetic energy of the locking mechanism is transferred to the medium contained in the bellows. In an arrangement of this type, the ancillary arrangement can be designed in a very simple manner, which in terms of its construction is highly cost-effective. On the other hand, if the arrangement is activated when a door that is open is to be locked, the medium contained in the bellows is compressed and is transferred via the force transfer element to the locking mechanism. Because of this property of the arrangement, the locking force must be inordinately low so that the locking mechanism is not activated too early. This has

I tried to think of 10 of the most interesting or eye-opening statements I've read. Some of the statements don't have links because I find them to be extremely obvious and there really is no explaining why they are true.
