Commercial Series Radio Cps R05.10 25

. X 10-12 in frequency. Wien bridge generators. The model of this generator worked satisfactorily at arbitrarily chosen frequencies in the range of 25 pulses/s. If, however, these parameters are selected appropriately in this frequency range, i.e., if the frequency of the generator is ensured in this range, then it can become a universal generator that meets all requirements. In this case, it is possible to build an oscillator that will operate at any given frequency, as long as it is not very high. The model of this generator is shown in Fig. 6. To obtain this design at home, you can use the VT2 transistor integrator (Fig. dd2bc28256
