Adobe's new date range rules can help you create specific sets of images for the years 2011, 2012, etc., based on the time when a photo was taken, the subject and location of that image, plus the date it was created. You can also tell Photoshop to (automatically) edit files accordingly. However, as with Lightroom, some filters and effects that are applied are not saved, so make sure to export your modified files to a new location first, and then backup your edited originals. Adobe says the new Look menu in the GUI has been introduced to "simplify retrieval of multiple settings." There is still the option to access them via the History panel with its "look and feel" improvements, standard Color Curves, and the 16-color Classic Look. In addition, the new History panel has come with other enhancements. There are now four levels for Key Words under a given history phase, and you can adjust the experience with a new Look mode option to capture or redisplay the Look-like settings. You view and re-apply these settings directly from the panel. This is a positive development that simplifies things a bit. Do don't worry though, you can still access the sophisticated Look-like settings via the Control panel. User Interface (UI) enhancements include a rounded palette bar in the interface, and an ability to benefit from a 12.8 MB set of grouped brushes. In terms of color models, Adobe has adopted G16 and RGB16 for its High-Key (HKEY, 16) and Sepia (SEP.) models. Lastly, a new Create Template feature lets you quickly apply a standard color profile to a group of edited images at the same time. You can even apply a custom profile for all of them (say, the Golden Eye color profile for a group of images that are portraits, or the Standard Photo color profile for your stock-image portraits).

What It Does: The Undo feature lets you undo your last action. The history can track up to 400 undo/redo commands, so it's easy to control what you did instead of trying to remember. Photo editing applications like Photoshop and Lightroom do much more than just take pictures. Tools like 'curves' can give your content some serious tweakage. The Color Adjustment tool lets you give your images a makeover with a few clicks. **What It Does:** With the Liquify filter, you can distort and stretch your images. Pinch, long-press, or pull on it to distort the image. Time-stretch your images into hyper-realistic landscapes. The Liquid Effect, like Brightness Contrast, is a tool for brightening dark shadows and lighting up dark areas of the image, making it easier to edit and retain detail. The Content-Aware Fill tool is a pretty versatile brush that can fill areas of your image in a matter of minutes. It copies pixels directly, like the Brush tool, but it works on the basis of image content and not color. This lets you adjust exposure, saturation, and so on, to achieve a more realistic result. The basic idea behind using a filbert is to create a perfect round corner. Click the Marquee tool and draw a box around the object you want to round. When you drag, the selection moves, fine-tuning the selection. **What It Does:** By default, the selection tools use the Average of the RGB channels, but you can adjust this to use the RGB or HSV color models. HSV lets you set how much of the H, S, and V channels the selection will use. 933d7f57e6
