-------------- Replaces all instances of one of the supplied keywords with another. Usage: ------ Keymacro Keyword1 keyword2 Example: -------- Keymacro "These are the words" "are" "words" Script Filter Description: ------------------------ A script filter is a way of loading scripts that can change the behaviour of Irrlicht. The idea is to provide a specific set of commands to be executed on a single frame, or as soon as a specific event happens. For example, you could use the script filter to trigger a frame-by-frame animation whenever the mouse moves or to ensure that no script gets executed until a given time. Example: -------- Irrlicht::createDialogArea() { //create the dialog DialogWindow *dw = new DialogWindow(); //add the button Irrlicht::button *button = new MyButton("Button"); //add the button to the dialog dw->addChild(button); return dw; } //when the button is clicked void DialogWindow::onButtonClicked(Irrlicht::button *button) { if (button->getButtonText() == "Button") { //put some code here to be executed when the button is clicked } } Usage: ------ Create a dialog box with a single button on it. When the button is clicked, some code should be executed. LoopScripts Description: ---------------------- This script filter runs scripts for each frame in a loop, and it will stop when no scripts are left to be executed. Example: -------- LoopScripts { //the code to be executed for each frame in the loop } Usage: ------ Example: -------- LoopScripts { //the code to be executed for each frame in the loop } UpdatableComposite Description: ------------------------ Allows you to change the state of the composite, changing the composited scene or creating new transparent surfaces that can be attached to your main composite, or anything else. Also, you can create Shaders and animate them. They will update automatically every time you change something in the scene (because they are attached to the "updatable" composite). Example: -------- Irrlicht::createComposite 2edc1e01e8

The aim of this project is to improve Irrlicht GUI's ability to create custom fonts. Q: Disadvantage of using Git with one laptop? I have a great feeling that Git is for a distributed version control system. It would be easier if I could use it on my personal laptop (Ubuntu 14.04) but it is hard to do so. Should I use it on my personal laptop? Or should I just use SourceTree on my laptop? A: I think it would make more sense to use the same tool across all machines you want to work on. So for example, use the same version of git. As for SourceTree, I prefer to use it across multiple machines. We have used it on two laptops, a VM and the source for my college CS class. It is pretty convenient to have your own version of git available on multiple systems. A: In my experience, it's a lot more convenient to use the same version of git on all the computers you want to work on. If you want to check out or get a git command to work on a specific machine, you can always find the correct version of git by getting the version number from A: Personally, I've been using Git for the last 2 years on about 10 computers with no problems. There are some things that, to be honest, I am still running into, mainly naming (i.e. I renamed the folder, but its history doesn't show the rename) and the fact that I can't merge 2 branches easily (for some reason, Git thinks I have some conflicts, and if I do conflict resolution with me vs them, it messes up the entire repo). However, it is very fast and easy to use and I don't think there is anything "wrong" with using it on your laptop. If you want to run into problems, there is also the fact that different computers have different network configurations (i.e. you may have to setup port forwarding for a specific port on your router). I would just setup a repo somewhere, and then clone from there on all of your other machines. I find that it is much easier to do that than to try and set up a repo on multiple computers at once. 1.
