Version: 1.5.0.0 Windows: Yes OS: Windows 2000, XP, Vista, Windows 7, 8, 8.1 Download Sync2PST Sync2PST - Free Download You may have heard of a Windows Server operating system dedicated to serving as a file-sharing device that's compatible with Windows PCs. A basic form of file sharing is already built into the OS, allowing users to share files with one another in the same system, but this is only half the story. In fact, Windows Server can be run in a special mode that requires additional software to access files that aren't stored in the local system. To get all the juicy details, PC Mag reader James Kelly-Poole did some research and discovered a recent tweak that lets Windows Servers act as a server for accessing files that're stored on network shares, via a feature called Server Core. The hack is simple enough to perform and it works on almost any Windows Server version, from 2003 all the way up to 2012. How to Enable Server Core mode on Windows Server You have three choices when it comes to enabling this feature on your Windows Server. You can either select "Use the features available to Administrators" or go the manual route and tweak the Windows registry. However, as we'll see in the second option, you'll also need to uninstall one of the core server services (otherwise you'll have to re-enable it later). The first step is to head over to the Server Manager (via the Server Explorer in the Server Center). After clicking "Servers" in the left pane, click "Configuration". Next, expand the "Role Services" section and select "Active Directory Domain Services". This is where you'll want to click "Uninstall". You're only removing the server service (Sql Server) rather than the OS, but the removal won't take much longer than the installation. You can then expand the "Applications and Services" section. Right-click "Services on Demand" (in the "Servers" list) and select "Restart the service", which will bring you back to the Server Manager. Scroll all the way down to "Windows File and Print Services", and right-click it to select "Restart". It'll reboot Windows Server, but you'll be able to access your shares via the "File Sharing" option in the Server Manager's "IIS" section. Once you've performed the above steps, you'll

Keyboard macros record you typing something on your computer keyboard and make it possible for you to repeat it at a later time. They make your keyboard serve as a keyboard shortcut. Keyboards on different operating systems may react differently to your press of a key, but typically, keyboards in Windows are active on Windows 8. What they do Keyboard macros function in the same way as voice macros do. That is, when you set them up, they record your keystrokes and store them for future reference. When you want to use them, you can record a macro while you are typing (by pressing CTRL + Alt + V), or you can record a macro by pressing the combination of keys on your keyboard. In that case, a pop-up window appears with information on the recording being saved. Once the recording is saved, you can choose to play back the recording when you want. It's recommended that you record macros while you are typing, because the tool is only active while you are typing. How to use To create a macro, click on the Macro Record button. You then must select the combination of keys to record. The keys can be in any order or with more than one letter. You can choose where on the screen the recorded keys will appear. How to play back the recorded macro In the same way as voice macros, you can click on the Play Macro button to play back your keystrokes and hear them again. You can edit a macro, erase it, or delete it. KEYMACRO: FAQ How

long does it take to record a macro? Most keyboards record a macro in less than a second. The speed of recording depends on the keyboard. Can you make my keyboard repeat something I have typed on a previous occasion? When you record a macro, you are making it so that your keyboard repeats the keystrokes you have typed before. To make your keyboard repeat something you have already typed, there are two methods: You can first type the text you want to make repeat, and then record a macro. When you are recording a macro, your keyboard will repeat what you typed before. You can also use a keyboard such as the Microsoft Natural Ergonomic keyboard 5000 that has an option to make a key repeat what you have typed before. Where can I record macros? You can record macros at any time by clicking the Macro Record button at the bottom right of the macro tool. In the macro tool, you can record a macro 2edc1e01e8

Tired of manually copying data from one PST file to another? Do you want to keep the size of your PSTs to a minimum, and to get an item-by-item comparison before copying? Are you sick of forgetting to import something, only to realize it's been lost in your backup? Sync2PST was designed to help Outlook users overcome all these common issues. It can synchronize any mailbox item between two PSTs. This is a straightforward tool that comes bundled in an intuitive interface. It has three modules ready for synchronization (copying files back and forth between the two PSTs until they become identical in contents) as well as for moving files from one PST to another only (right sync or left sync). Additional settings are available for users looking to set up a scheduler, thus allowing the application to perform the sync job automatically, without human interaction. This can be done hourly, daily, weekly or monthly. Additional settings are available for users looking to set up a scheduler, thus allowing the application to perform the sync job automatically, without human interaction. This can be done hourly, daily, weekly or monthly. Allows you to synchronize between two.pst files. The migration tools will synchronize, compare and migrate all your emails, attachments, calendar items, tasks, journals and even the.ini file if needed. Main features: 1- One PST/ Outlook file is treated as "Master" and the other is treated as "Slave" 2- You can choose to "Sync" (move emails from "Master" to "Slave" and vice versa), "Unsync" (the opposite). 3- You can specify which files to synchronize, email, contacts, calendar, tasks and journals 4- The synchronization tools will compare one item at the time and will not allow you to synchronize more than one email at a time. 5- It will only synchronize the new items on each folder and will not migrate older emails, calendars, tasks, journals and ini files. 6- You can choose to sync by color, label, status and whether it's private, or public or send/receive. 7- You can define a scheduler. This will perform the synchronization at a defined time (every hour, every day, every week, every month, every year, etc.) 8- If you want, you can choose to move all emails from "Slave" to "Master" and vice versa.
