Thanks to the widespread adoption of 3D across the industry for creating stereoscopic experiences, Photoshop's 3D capabilities are beginning to be phased out for 2017, with support for 3D content being moved out of the main Photoshop product and into more of a plug-in-based approach. Although this model was first introduced for native 3D content in Photoshop, the support for 3D layers and [Photoshop 3D layer](https://blogs.adobe.com/photoshop/2017/06/introducing-multiview-layers-for-photoshop-cc-2017-2/), as opposed to traditional 3D Layers, were moved out of the main Photoshop application and into a better-supported plug-in model. As we mentioned earlier, this release introduces new ways to resolve blending issues when scaling and warping assets. If assets are not properly sized in relation to the new blending modes, you may find these issues as you use and scale your asset using your favorite Mantra production apps or by exporting your assets to different apps like Final Cut Pro and importing into Photoshop. These tools can introduce different resampling and compression artifacts which can cause these asset blending issues when you scale the asset. In order to make it possible for Photoshop to process animations with AI Blending and indicators, the post processing effects had to be re-encoded to selectively apply the effect earlier. But, that's in the future. The number of people using Adobe Photoshop has been dramatically reduced over the last several years, resulting in a much lower RAM requirement. We have added more RAM to Photoshop CC 2017 to increase the RAM requirement while maintaining the native look and feel.

This selection tool allowed you to "hide" areas of the target image by applying a mask. In some cases, this mask would also be a mirrored copy of the content you were selecting (as defined by your selection tool settings)—for instance, an area where both the foreground and background of an image would be selected is a common behavior. With this feature, you would look at the Normal or Mask or Layers panel, and the masked areas would be blacked out, while the rest of the image would remain visible. Tracing was a cross-platform tool used to take a live on-screen selection and measure the distance to an unclipped object or area of the image, and create an anchor point to map, auto-populate, or perform a more complex path-finding technique. After the tracing was completed, you could see the anchor point's location as a clickable marker. Once this was set, you could drag in the image and move the anchor point to dictate the path. This tool, available with many of the plug-ins owned by Adobe, was a once-powerful tool that attempted to "fill in the blanks" with content from the image. However, because of the tool and underlying AI engine, this tool had previously been considered too complicated to be usable as a replacement for other more traditional "fill-in-the-blanks" tools. With Content-Aware Fill, you would have the ability to choose a gradient to control how the color blending would occur and to blend the content, as well as a clipping mask. You could also blend in the content from other images as well the first image. This feature was a great tool to remove the extra, unwanted objects—like large logos in the background of your photos. However, once adjusted to your liking, the "fill" had to be done in "burn/bleach" mode to avoid the AI-engine from rendering an all-out color.
